

Cumulative total as of the selected day · both day bars share one scale (larger value fills) · logged time tagged "social media"

Annotation only — none of this is part of the page. The wireframe is the target.

1 · Logo placement. The `a.` mark is 34px square, radius 8px (~24% of the square), solid `#1a1a1a` with the period in `#b4562f` — no wordmark, no border, no drop shadow. It sits on the same flex row as the `≡`, pinned right via `justify-content: space-between`, so both stay put as the column widths change. It links to `/shelf`. Don't add it to the sidebar-expanded views — there the wordmark already carries the brand.

2 · Typeface. Every screen is set in **Patrick Hand** (Google Fonts, weight 400), with **Gloria Hallelujah** reserved for the one handwritten aside per screen. The build is falling back to a system sans — load both families and set `font-family: 'Patrick Hand', system-ui, sans-serif` on `body`. Numerals inherit the same face; only small tag labels and code-ish text use `ui-monospace`.

3 · Book title case. Titles render **as the book prints them** — title case, every principal word capitalised: “The Way of the Superior Man”, not “the way of the superior man”. Don't lowercase or uppercase titles in CSS; store and display the publisher's casing. Author line stays sentence case. The app's own UI labels stay lowercase (“total pages read”, “pages read today”) — that contrast is deliberate.

4 · Total-pages-read panel ground. The panel is **cream** `#fbf9f4`, not white — it's the one panel lifted off the white page so the persistent metric reads as separate from the per-day bars. Border `2px #1a1a1a`, radius 11px, padding 16px 18px. The bar *inside* it is white `#fff` with an ink fill so the fill has something to sit against; don't collapse the two to one colour.

5 · Colour hygiene. Body copy greys are `#6b6559` (never `#999` — it fails contrast on cream), terracotta accent `#b4562f` with `#8a4525` for accent text, dashed section rules `2px dashed #cfcabc`.

6 · Numbers on this screen. Total 148 of 195 = cumulative through the selected day. Day bars share one scale — the larger of the day's two values fills 100% (5 Sep: could've 59 fills, read 12 = 20%). The logged time carries a small uppercase “social media” tag so the figure is never ambiguous.
