

Captured mid-animation: shimmer sweeping the book, skeleton lines inking in, bar at 62%

**SPEC**

Annotation only — the live wireframe loops the animation; in the product it runs once and ends when the data lands. **Shimmer:** a 60%-wide highlight sweeps the book left→right, 1.6 s linear, looping while the fetch is open. **Skeleton:** the five grey lines ink in top-to-bottom, one per completed request (title → author → progress → today's log → history), so the book is drawn by the arriving data. **Progress bar:** tie its width to real work, not a timer — loaded ÷ total requests, eased 200 ms per step, never jumping or reversing; start at 4%, and never sit at 100% before navigating (the shelf cross-fades in on the frame the bar completes). No reported total → hold at 90% and let the shimmer carry the wait. **Timing:** minimum 600 ms so it can't flash; status swaps to "nearly there..." at 4 s and to the slow state at 10 s. Respect prefers-reduced-motion: drop the shimmer and dots, keep the bar.

First sign-in with no book yet, and the slow / failed state after 10 s
